

P3: Project Implementation

How well did you fulfill the promise of your proposal? Did you implement what you planned?

I don't think I fulfilled my promise of my proposal that well. I first had to pivot from designing a AR glasses concept to a smartwatch concept as it was not possible to accomplish with the materials I had selected. Then I had to pivot from a Arduino nano to a Arduino Uno last minute as the nano broke. This greatly changed the purpose of the product and its ability to accomplish its main function.

Did you satisfy the design requirement of the project, as described in the P1 document?

- **use a reasonable number of component modules**
- **have a mixture of input and output components ?**

In my original concept of the watch I did have a reasonable amount of components with a microphone and button as inputs and buzzer with display as outputs. But with the Arduino nano dying and having to use the uno, it meant I didn't have access to the microphone anymore.

Did you use any clever, creative, or innovative techniques in your implementation?

For my nano version I tried to use a screw in terminal adapter to secure the wires in without having to solder any of them. My nano version also utilized TinyML and edge impulse to train a model that would recognize the user's voice.

Is your physical mockup communicative, expressive, fun, effective?

Does your system work? Can we understand the purpose and functionality of the prototype?

My physical mockup partially works as the nano version broke and the uno version does function but doesn't fit properly into the 3d encasing.
